

AI Concepts - Sample PDF (Day 13)

Artificial Intelligence (AI) enables machines to perform tasks that typically require human intelligence. Key areas include Natural Language Processing (NLP), Computer Vision (CV), and Machine Learning (ML). NLP focuses on understanding and generating human language, while Computer Vision deals with interpreting images and video. Machine Learning learns patterns from data; Deep Learning uses multi-layer neural networks to learn rich features. Retrieval-Augmented Generation (RAG) combines a retriever and a generator so answers can be grounded in source documents. For RAG quality, chunking matters: fixed-size windows, sliding windows with overlap, or semantic chunking by paragraphs/headings.
